Method-specific spatial velocity fields

Extended Data Fig. 9 | Spatial transcriptomics: method-specific velocity fields. Twenty available method fields for all 1,292 ST_raw spots are arranged left to right and top to bottom in descending ST_raw GDC order. The six target cell types (608 spots) use the colors in Fig. 5a; the other 684 spots are grey. All fields retain identical fixed spatial coordinates and the existing equal-aspect and streamline settings. The shared legend identifies the six target types and the non-target background. The all-cell and target-cell views and the five reference relations are shown in Fig. 5a; those arrows are predefined evaluation relations, not measured spatial trajectories. Fig. 5a shows the ST_small fields, whereas the fields here use ST_raw. TopicVelo integrates native stochastic transitions from eleven topics with at least two genes showing variable U/S signal; its spatial field is projected directly from the native transition matrix. One TopicVelo ST_raw spot has an undefined direction and is excluded from directional scoring; the reference denominator remains 608 spots. TopoVelo uses the archived predictions. Historical scores and the removed score panel remain available in the source data and archived artwork.
